

Game Arcade

Forty hypercasual games in one install, on one wallet and one social graph. A shelf that refills every day — built for frequency, not for sessions.

01

The thesis

DAU/MAU is the company

- Every other consumer metric is downstream of how often someone opens the app.
- Frequency follows content volume, not content quality — YouTube beats Netflix on DAU/MAU while losing on polish.
- Hypercasual games are the highest-volume content there is: a loop is learned in four seconds and exhausted in thirty.
- Their fatal flaw is distribution — each one is a separate install, and a separate uninstall a week later.

40

Games at launch, one install. A new drop every Thursday and a new variant every day — the shelf refills without the player going to a store.

Where frequency lives

Netflix

Few titles, expensively made. Opened weekly, on purpose.

YouTube

Endless titles, cheaply made. Opened hourly, by reflex.

One hypercasual game

One loop, one install, gone inside a week.

Game Arcade

Forty loops behind one icon, and a reason to open it tomorrow.

One app, not forty

FORTY SEPARATE APPS

GAME ARCADE

New game	A store listing and an install	A drop inside the app
Currency	Forty wallets, none of them full	One wallet, spendable anywhere
Social graph	Rebuilt per game, or absent	One graph across every game
A friend's score	Reaches you nowhere	Reaches you on the home shelf
7 ← Game Arcade — confidential		
Retention surface	A push notification	Feed, duels, streaks, drops

02

The product

A shelf that ranks itself

- Today's variant takes the top of the page, on a countdown.
- Three ranked rows state their reason in red — who beat you, and by how much.
- Twelve pinned games below; twenty-eight more a tap away.

Every run is a race

- A friend's recorded score ticks up beside yours, live, from the first second.
- Thirty seconds long. One input. No tutorial, no loading screen.
- The reward screen is the product: score, ghost, coins, and what happens next.

One graph, forty games

- The feed is generated, not authored — every run posts itself.
- Duels are asynchronous: a score and a ghost, never a lobby.
- Every post carries a verb aimed at you: beat it, race them, try it.

Volume, and one wallet

- Forty games in a numbered index, filtered by input: tap, swipe, timing, numbers, memory.
- Long-press pins a game to your twelve. Nothing is ever locked.
- Coins earned anywhere are spent anywhere — on continues and retries, never on access.

03

The loop

Sessions do not end

The queue picks a game where a friend just beat you, states that reason on the card, and loads it unless the player stops the ring — the one red square is the only moment they are asked to decide.

Two off your best

- Coins are asked for once: at the near miss, where the number is still on screen.
- Three retries a day are free — the mechanic teaches itself before it charges.
- A retry resumes at the score reached, so the spend buys progress, not a restart.

Five reasons to come back

Daily and weekly

A variant of an existing game every day, on a countdown; a brand-new game every Thursday that stays on the shelf for good.

Rivalry

Async duels and head-to-head records. Nobody waits for a lobby, and every ghost expires — which is what makes it urgent.

Standing

Streaks, five daily quests, a seasonal ladder that resets, and squad targets that need seven people to hit.

**“Sessions never end on purpose —
but leaving is always one tap, and
always visible.”**

— the product rule the whole app is built around

04

Where it stands

What exists today

STAGE	STATE	NEXT
Prototype	Fourteen screens, navigable	User-test the queue
Playable games	STACK, REFLEX, DODGE	Seven more by hand
UI spec	Screens, components, copy	Handed to design
Build brief	Expo, seven milestones	APK to fifty testers
Catalogue	Forty defined, three built	A drop pipeline

The two numbers that decide it

Distinct games per session

Does volume actually get consumed, or does everyone play one game and leave? If this sits at one, the aggregator has no reason to exist and the thesis is wrong.

Queue acceptance rate

Of the runs that auto-load, how many are played rather than cancelled? This separates a session that extends itself from a pattern that reads as a trap.

Play it.

The prototype runs on a phone browser today — three games playable, the whole shell navigable. The build brief turns it into an APK in seven milestones.
